**UNFIRE FLAMERANGER -
Advanced, Fully Automatic
Fire Detection & Extinguishing Systems
Utilizing Robotic Nozzles**

Mattias Eggert

Managing Director and Owner

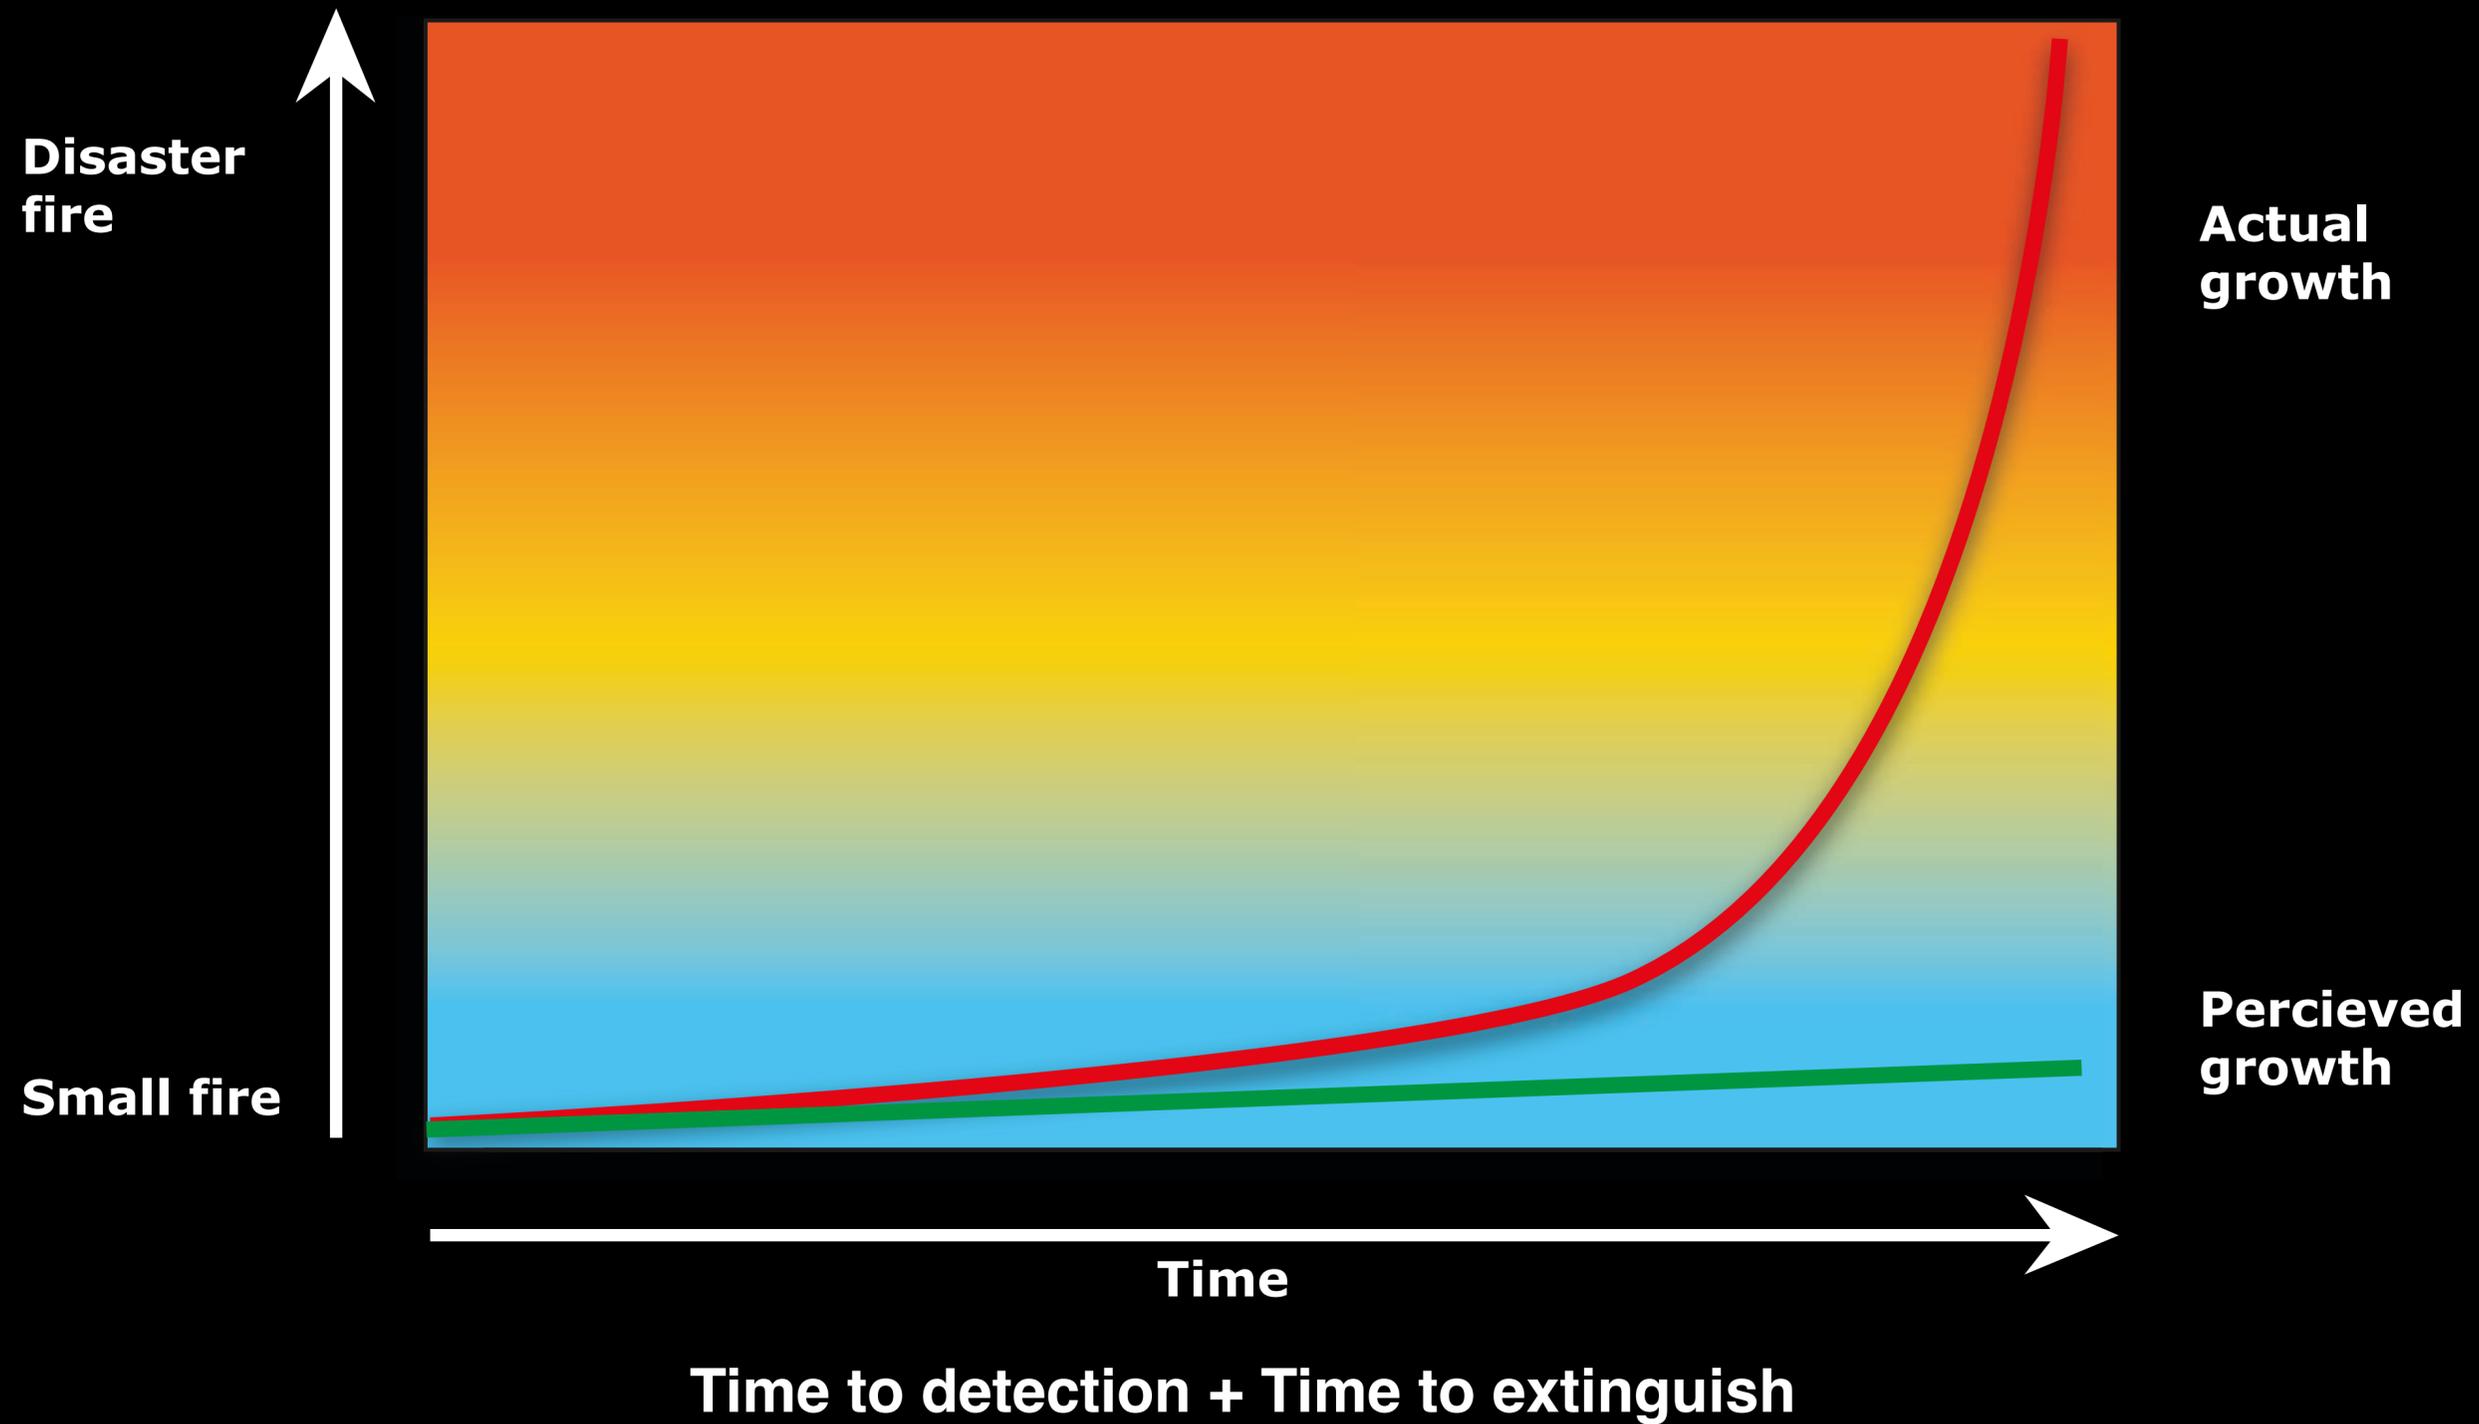

Roger James

Director of International Sales & Marketing

Today's Presentation

- I. What is the problem? And is this the solution?**
- II. Applications other than preventing exterior high rise facade fires**
- III. 3-min video presenting the FLAMERANGER XT**
- IV. Testing by U.S. Naval Research Lab & Jensen Hughes**
- V. System components. Technical overview.**
- VI. Conclusions**

FIRE grows exponentially.

Bradford, England 1985 - 56 persons died

Fire starts

30 seconds

60 seconds

90 seconds

120 seconds

Fast detection + **Fast** extinguishing = Disaster **prevented**

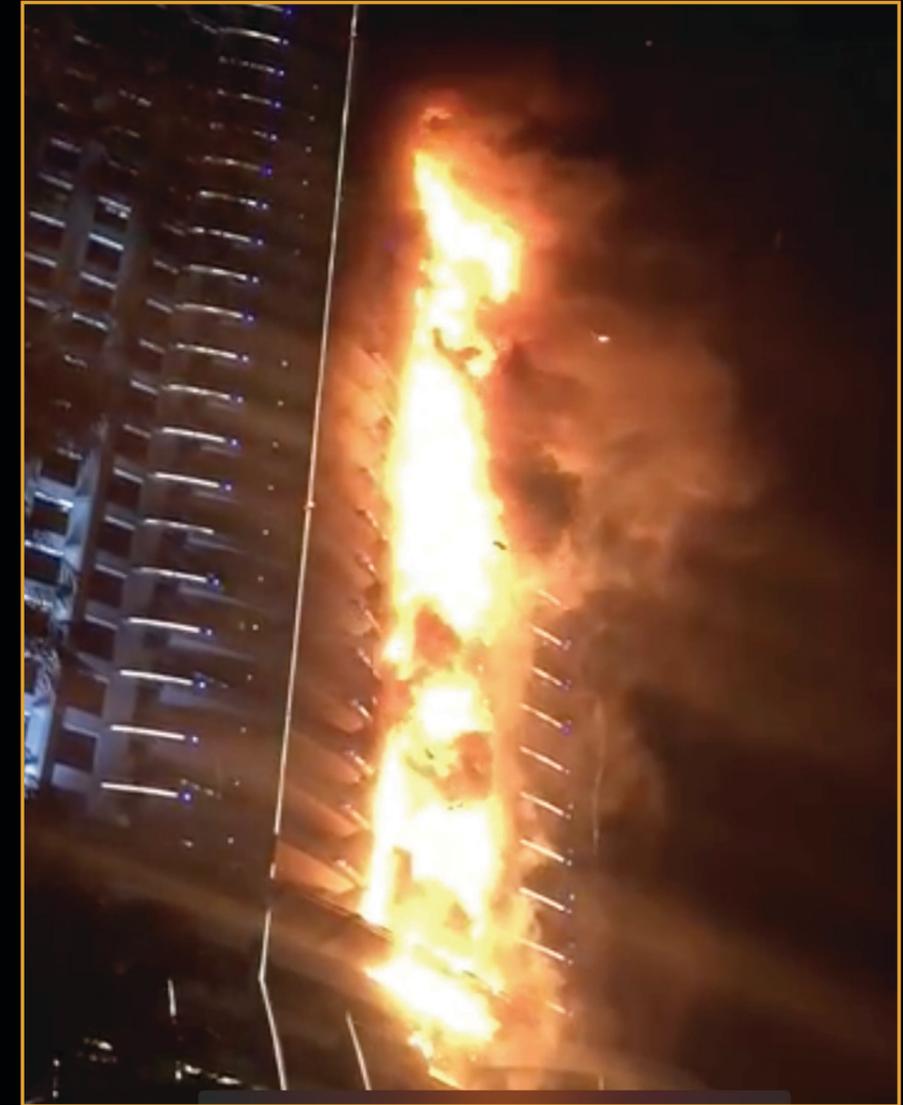

The ADDRESS HOTEL, Dubai. Evening of Dec 31 2015

Just a few hours earlier

video start: 4 Floors on fire

80 sec : 20 Floors on fire

II. Applications

Marine Fire Protection:
Large Volume Spaces,
Helidecks, etc. on
Naval Vessels & Ships

Oil & Gas Facilities:
Targeted, high-volume foam
suppression in seconds

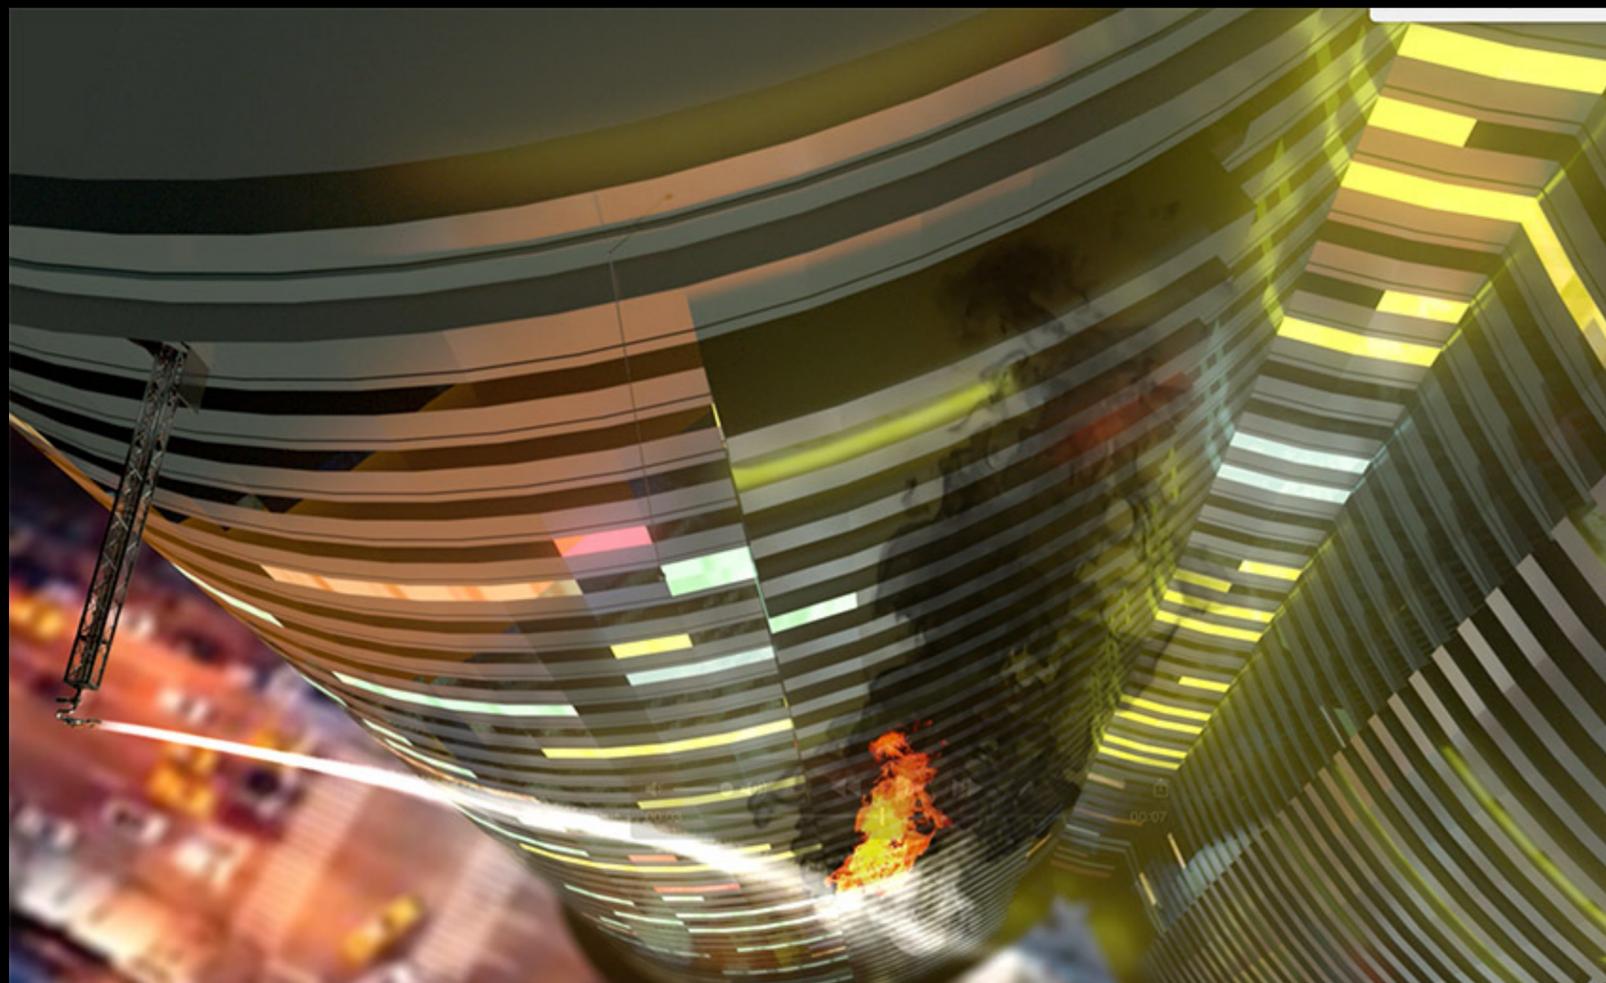

II. Applications

Marine Fire Protection:

FIRE

FLAMERANGER

- Fully automatic fire detection and fire extinguishing system
- Active response within seconds
- High flow for forceful, effective intervention
- Pin point aiming accuracy = very high water density
- Follows flames dynamically
- Auto shut-off when flame is out ensures minimal use of water with minimal water damage

.... acting just as a fire fighter would.

The FLAMERANGER system was tested by US Navy NAVAL RESEARCH LABORATORY September 2015 with spectacular results

with spectacular results

US NAVY TEST RESULTS:

Fully Automatic Mode

7.3.2.3 Test FS-9: Large Fire Prevention (Automatic Activation and Targeting)

“The system detected the fire so quickly, that the firefighting party igniting the heptane pan fires below the stacks of pallets, had to run out of the hangar after ignition. The system applied water to the fuel package within 5 seconds of ignition. The applied water prevented the pallets from igniting but the heptane pans located below the stacks continued to burn until all of the fuel (heptane) in the pan had been consumed. The continued burning of the pans was expected since the monitor was discharging water during this test. If the monitor had been discharging AFFF, the heptane pans would have been immediately extinguished.”

US NAVY TEST RESULTS:

3 Min. Pre-Burn, Then Fully Automatic

“7.3.2.4 Test FS10: Large Fire Suppression (Delayed Automatic Activation and Targeting)

“The system detected and aimed the monitor at the fire within five seconds of ignition but the water supply was not activated until three minutes later. Within seconds of water application, the fire was quickly suppressed with the residual burning located low, on the backside of the two stacks. **By 15 seconds into the discharge, there was no visible flaming inside of the stack of pallets** but the heptane pan fires located below the pallets continued to burn for almost a minute. FS-10 was actually the first test conducted in the test series and the amount of heptane used in the pans to ignite the pallets was reduced after this test.

US NAVY TEST RESULTS:

Multiple Small Fires, 1 Min Pre-Burn, then Fully Automatic

“7.3.3 Multiple Small Fires

“... a test was conducted at the end of the test series to assess the systems’ [sic] capabilities against multiple fires. Three wood cribs were used during this test. ...The cribs were ignited (using small pans of heptane) and allowed to burn for one minute prior to activating the monitor system.

“According to the manufacturer, the detection system records the location of the three fires and attacked the fires in the order in which they were detected. The system initially applied water to the fire located in Grid Sector 2. Within a few seconds of water application, the fire was completely extinguished. The system then applied water to the fire located in Grid Sector 7. Within a few seconds of water application, the fire at this location was also completely extinguished. The system then applied water to the remaining fire located in Grid Sector 5. Within a few seconds of water application, the fire at this location was also completely extinguished.

US NAVY TEST RESULTS:

Table 3 – Large Fire Suppression Test Results

Test #	Description	Activation Time	Control min:sec	Extinguishment min:sec	Total Water (gal)
FS-7	Large Fire Suppression (Manual Control)	3:00 pre-burn	0:10	0:20	<100
FS-8	Large Fire Suppression (Pre-programmed Targeting)	3:00 pre-burn	0:15	0:30	125
FS-9	Large Fire Prevention (Automatic Activation and Targeting)	0:10 act.	instant	instant	<25
FS-10	Large Fire Suppression (Delayed Automatic Activation and Targeting)	3:00 pre-burn	0:10	0:15 wood 1:00 pans	~65 wood 250 pans

FLAMERANGER

System components

2 x FV300

TYCO FV300 IR Array Flame detectors

- **Extremely quick flame detection**
- **With high resolution**
- **Provides the X-Y angle and size of up to 4 flames**
- **Immune to false alarms**
- **Detects a 0.1m²-heptane pan fire from over 50 meters**
- **90° horizontal and 80° vertical field of view**
- **SS316 stainless steel housing**
- **MODBUS communication protocol**

FORCE 50

UNIFIRE FORCE Robotic Nozzle

- BLDC industrial-robot-type motors (up to 10.000 hours)
- Position accuracy better than 0.1°
- Full 360° horizontal, and +/- 90° vertical range
- Unique, ultra effective INTEG jet/spray nozzle
- 316L Stainless Steel and bronze design
- Minimum maintenance
- Flow: 500 - 5000 lit/min
- Reach: up to 50-85 meters

FLAMERANGER Software

The screenshot displays the FLAMERANGER software interface. At the top, a red banner indicates "Fire Detected". The main view shows a 3D model of a room with a fire detected in the center. To the right, a line graph shows the "Alarm Trigger level" rising above the "Attention level" and "Normal operation" thresholds. Below the graph, two detector panels are shown: "Detector 1" with an alarm level of 5 and "Detector 2" with an alarm level of 4. Each panel includes an "Analog scan" visualization and "Raw Data" for N_RX, N_WVE, N_WVP, and WMKADC4. At the bottom, a "Water Cannon" section shows the valve is "OPEN" and the position is set to x-axis -51° and y-axis 12°. An "Active Alarms" table lists the detected fire with its time, coordinates, height, and system action.

FORCE 50

TARGA PLC

FLAMERANGER

FLAMERANGER Software

- Processes fire alarm and position data from up to 4 x FV300 detectors
- Determines size and position in 3D for up to 4 flames at once
- Aims the Robotic Nozzle to the flames
- Opens valves or start pump
- Oscillates the stream, and adjusts nozzle spray and elevation
- Follows flames dynamically if fire spreads
- Turns off the valves & returns to stand-by when flames are out
- Each Flameranger operates fully autonomously

TARGA PLC

FLAMERANGER

Web server

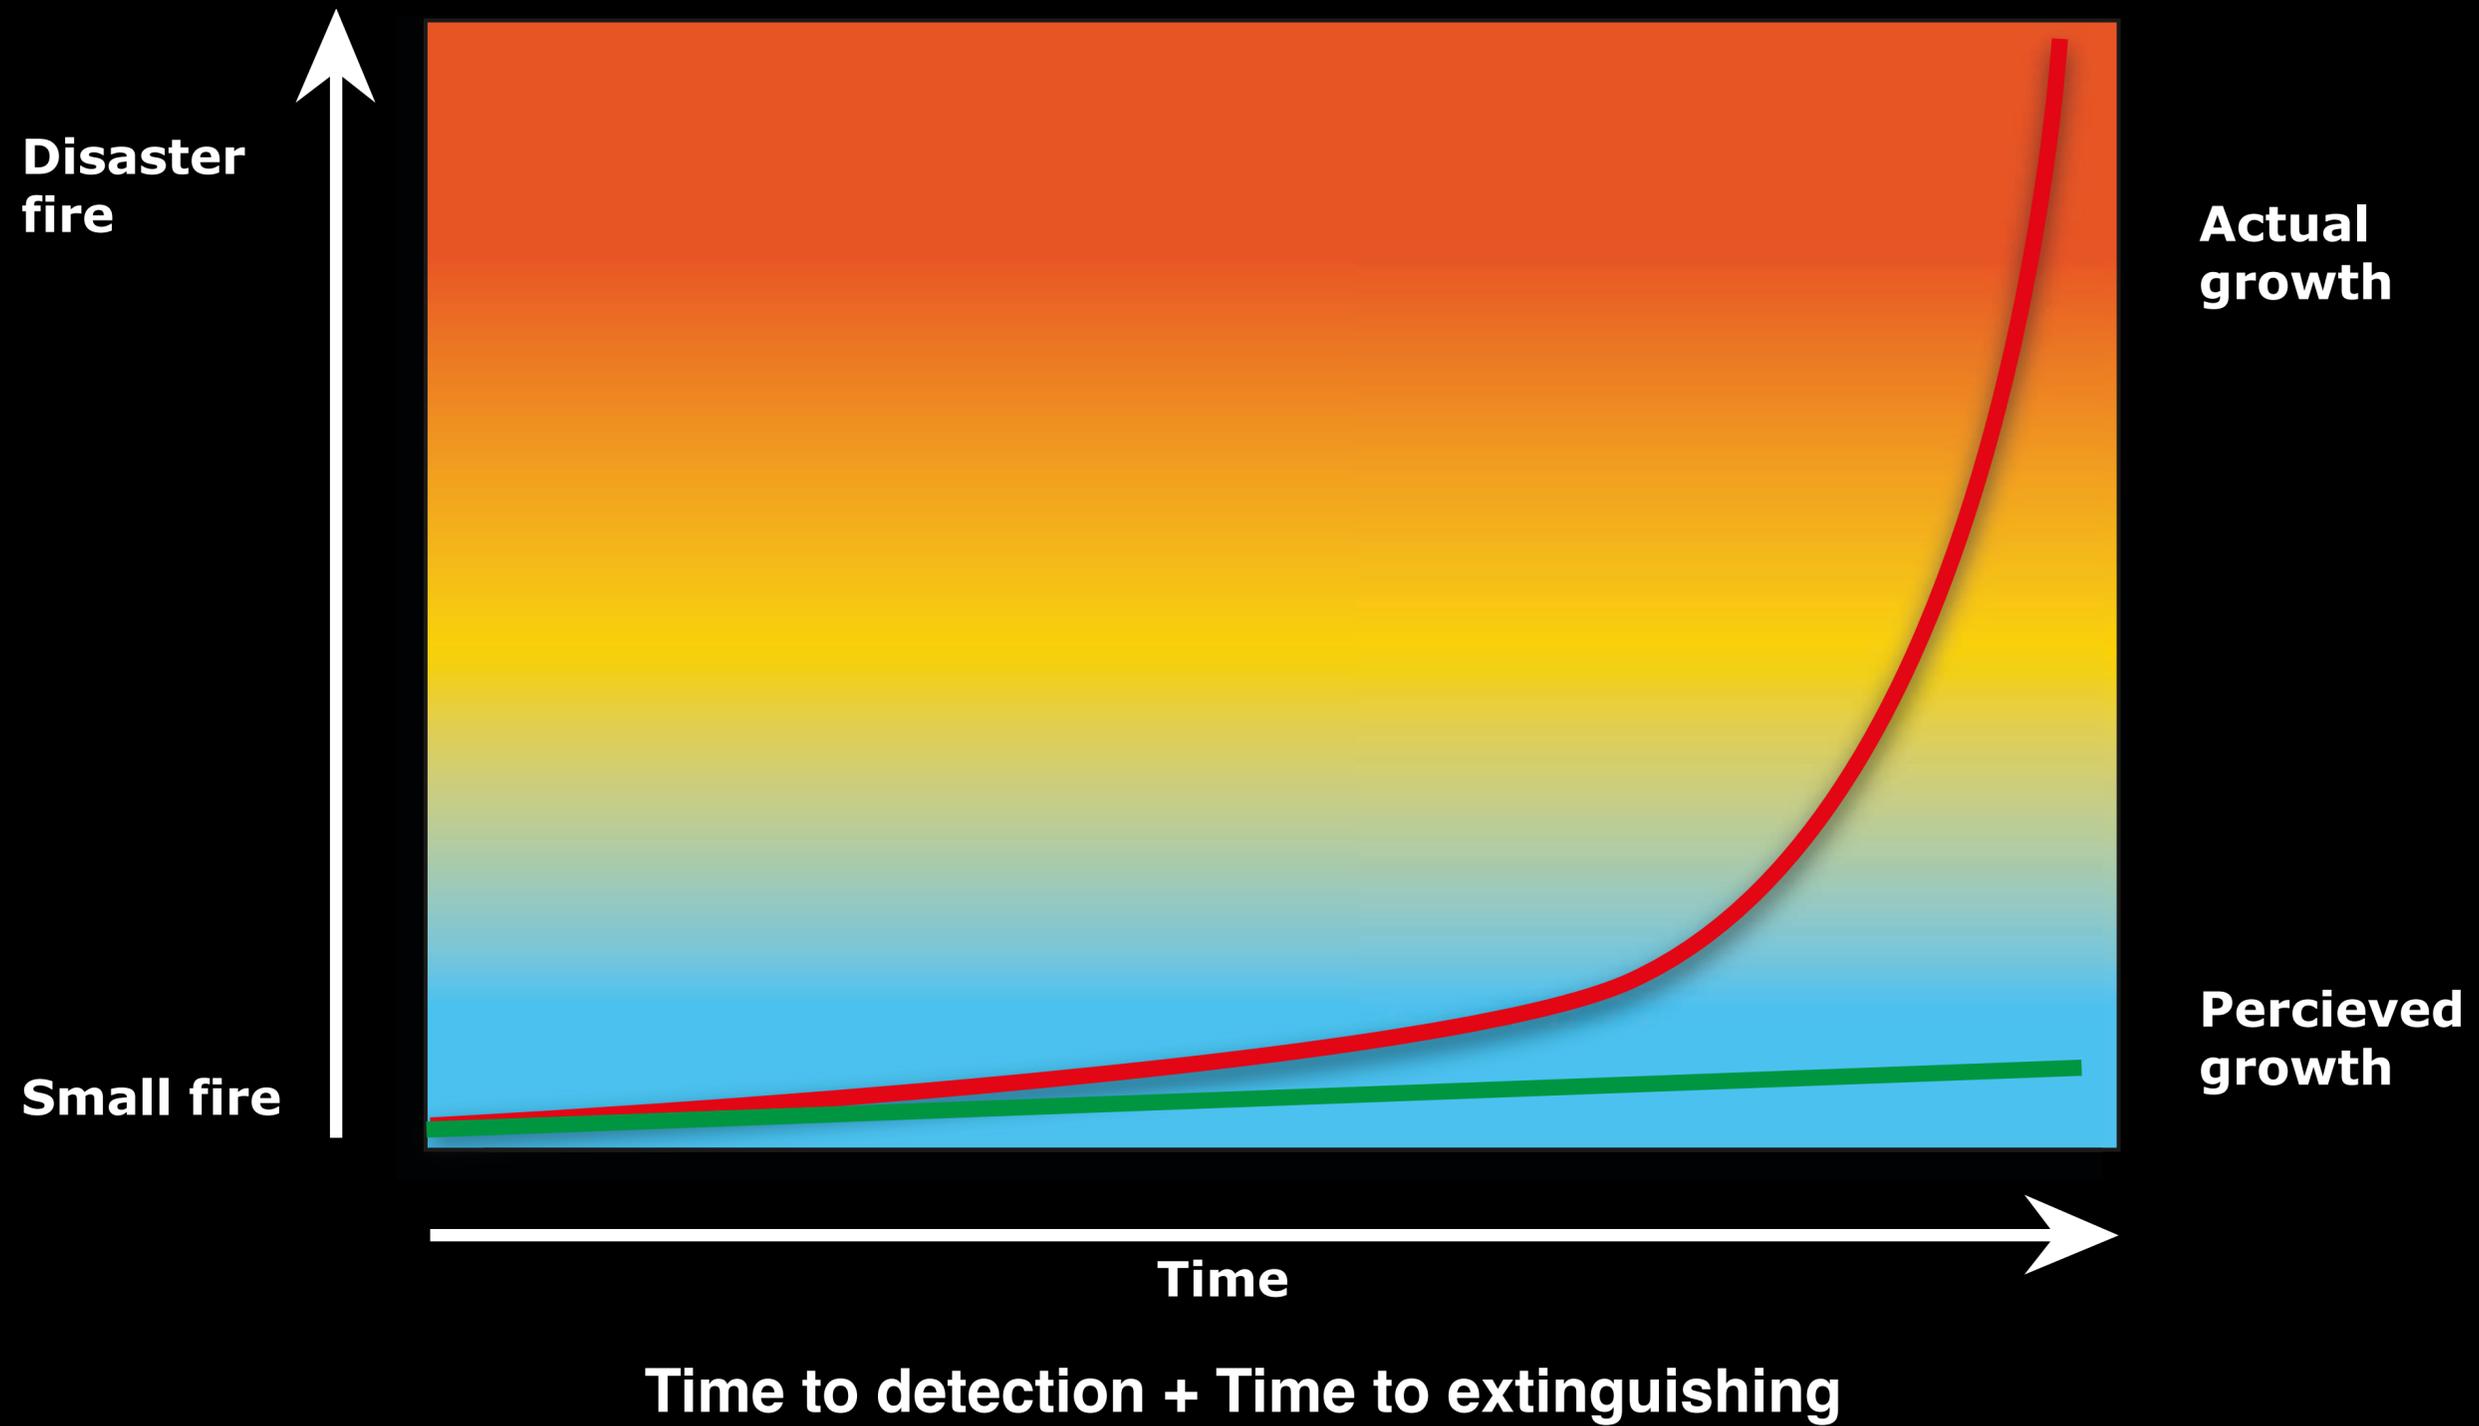

Web server & Human User Interface (HUI)

- Embedded LINUX PC provides TCP/IP connection
- Supports infinitely large networks
- Supports automation over TCP/IP network
- Allows Control from any device with a web-browser
- Allows to see total system overview
- Connect to each individual TARGA PLC to see status
- Allows upgrade of the TARGA and FLAMERANGER software remotely
- Thereby support anlimited number of "control stations"

24/7/365 System monitoring and remote control from Command center and/or Smartphone
